                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TITLE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               COMMENT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                              (http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (41) 4792114 [4p] AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the innext adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         à
                                                                                                                                                                                                                                                                                             (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMD42 (gi|4732114|gb]AF129072.13, a copy-number induible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

Identifying two nucleotides which are separated by an interval in double stranded nucleic acid using restriction endonuclease that generates 5' overhang, template-directed ligation to labeled adaptors and amplification

Example 2; Page 29; 59pp; English.

The invention relates to an iterative and regenerative method for sequencing DNA. The method involves identifying two nucleotides which are separated by an interval in double stranded (ds) nucleic acid using restriction endonuclease that generates 5' overhang, template-directed ligation to labeled adaptors and amplification. The method is useful for identifying a first nucleotide as second nucleotide n+x in a defentifying a first nucleotide as second nucleotide n+x in a defentifying a first nucleotide of a second nucleic acid segment which is a genomic DNA, cDNA, a product of product or a product of a strand displacement amplification (PCR) in vitro DNA amplification e.g., a polymerses chain reaction (PCR) or product or a product of a strand displacement amplification or a vector insert. It is several of staggered ds molecules produced from the double stranded nucleic acid segment. It is useful for removing all or a part of a primer sequence from a primer extended product and for automated sequencing of double-stranded DNA segments. The method of the invention.

Novel nucleic acid encoding mammalian SNORF25 receptor, for treating abnormalities such as steroid hormone disorder, hypertension, diabetes, asthma and respiratory disorders Boyle N, Thompson TO; ischemia-reperfusion injury; PCR primer; ss. Disclosure, Page 58; 146pp; English. Borowsky BE, Adham N,

The present PCR primer was used for RACE amplification of cDNA encoding a rat SNORF25 receptor. Antagonists of SNORF25 receptor polypeptides can be used for regulation of disorders of steroid hormone, epinephrine respiratory, immune, endocrine, cardiovascular, electrolyte balance, respiratory, immune, endocrine, musculoskeletal, neuroendocrine, cognitive, memory, senatosensory and neurotransmission, motor coordination, sensory integration, motor integration, dopaminergic function, appetite such as anorexia or obesity, somatosensory neurotransmission, olfaction, autonomic nervous system, respiratory, immune, endocrine, musculoskeletal, neuroendocrine, cognitive, memory, affective, blood coagulation related, or developmental, or regulation of hypertension, diabetes, pain, psychotic behaviour, migraine, cancer, proliferative diseases, wound healing, tissue regeneration, or ischemia-reperfusion injury related diseases

Cystic fibrosis transmembrane conductance regulator gene adapter #31.

primer extended p RERD; primer; ss.

US6190889-B1

The present invention describes a method for removing a primer sequence (PS) from a primer extended product (I) or blocking restriction endonuclease recognition domain (RERD) in (I) involving digesting (I) with: (a) a RE recognising double stranded (ds) RERD comprised by PS in (I); or (b) an enzyme that recognises ds enzyme recognition site in (I) thus blocking outling mediated by RERD in (I), respectively. The method can be used for removing a primer sequence from a primer extended product or blocking restriction endonuclease recognition domain in a primer extended product. The method is useful in DNA sequencing methods including mediaal diagnostics, genetic mapping, genetic identification, forensic analysis and molecular blology research. The present sequence represents a cystic fibrosis transmembrane conductance regulator gene adapter which is used in an example from the present invention for the demonstration of interval sequencing mediated by class-IIS restriction endonuclease generated 5' overhangs and template-directed ligation. Removing primer sequence from, or blocking restriction endonuclease (RE) recognition domain in primer extended product, comprises digesting product by RE or an enzyme which cuts the RE recognition domain Gaps Regenerative method; sequencing; strand displacement amplification; restriction endonuclease; identification; adaptor; ss. . 0 Length 24; Adaptor oligonucleotide #27 used in the invention. 1.1%; Score 17.2; DB 1; 82.6%; Pred. Dallman MJ,

The invention relates to use of a modulator of a Hedgehog signalling pathway or a modulator of a target of the pathway in the preparation of a medicament for treating T-cell mediated disease or infection or a disease or disorder associated with increased or decreased T-cell apoptosis and for modification of (pertipheral) T-cell activation or proliferation or T-cell apoptosis, and for modulation of the Norch signalling pathway in immune cells. The modulator is useful for treating cancer of the breast, prophomes and carcinomes, autorimmune diseases such as systemic lupus erythematosus, multiple solerosis and diseases such as inflammatory diseases such as confidence of the properties of the properies of the properties of the properties of the properties of the proliferative disorders such as atherosclerosis and psoriasis, viral lifections such as AIDS and herpesviruses, genetic immunodeficiencies, neurodegenerative diseases such as AIDS AID telmer's disease and Parkinson's disease, myelodysplastic syndromes such as aplastic anaemia, ischaemic disease, myelodysplastic syndromes such as aplastic anaemia, ischaemic ciribusis such as myocardial infarction, toxin-induced diseases such as ciribosis and wasting diseases such as cachexia. This sequence represents a reverse transcriptase PCR (RT-PCR) primer used in the scope of the Example 10; Page 110; 154pp; English nvention

Human cystic fibrosis transmembrane conductance regulator oligo #29

```
This sequence is an oligonucleotide used to describe a sequencing method which identifies the first and second nucleotides in double (ds) nucleic acid segments. The method can be used to sequence DNA, for example, in genetic identification, forensic analysis, genetic counselling or medical diagnostics. The method sequences in discrete intervals that start at one end of each DNA segment. The method overcomes problems inherent in other sequencing methods, such as the need for gel resolution of DNA fragments and the generation of artifacts caused by ss DNA secondary structures. It can be used to create offset collections of DNA segments, and sequence the segments in parallel, to provide continuous sequence information over long intervals. This method is also suitable for automation and multiplex automation to sequence
                    genetic identification, forensic analysis, genetic counselling; medical diagnostic, offset collection; multiplex automation; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                              Sequencing of double stranded nucleic acids - by an iterative and regenerative method which uses a restriction enzyme with a cleavage site separate from it's recognition site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 24 BP; 4 A; 6 C; 11 G; 2 T; 1 other;

agents that can modulate activity of cellular proteins involved in tissue expand a population and differentiation. Hedgehog proteins can also be used to expand a population of neural stem cells from a subject, then the cells Alzheimer's diseases or spinal cord injury. Bigenic animals derived from Alzheimer's diseases or spinal cord injury. Bigenic animals derived from from a simple cross since the transcribtion activator and the silent transgene are maintained in separate mouse lines, and abnormal expression is only induced in the biganic animal. This eliminates the need for microinjection and genotypic screening for each experiment, and many bigenic embryos can be produced by cross-breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                  product; noodle product; pasta product; cake; LipA;

```
The present invention relates to a method for determining the presence of neoplastic molecular markers in a host, involving the use of neoplastic molecular marker specific reagents to detect such markers and analysing the array of reagents, allowing the identification of the neoplastic disease present. This can be used to determine the best treatment for another, in particular neural cell, lung and prostate tumours. The present sequence is a PCR primer useful for detecting the coding sequences of markers of the invention.
                                                                                                                                 Human, cancer, neoplastic disease; tumour specific marker; cytostatic, transcription factor; PCR; primer; ss.

The invention relates to a method of preparing flour dough for preparing baked products. The method involves adding an enzyme that hydrolyses glycollpid and phospholipid, but not triglyceride and/or 1-monoglyceride, to dough components and mixing dough components. The method is useful for preparing a flour dough which is useful for producing baked products, a moodle products, pasta products and cakes. The invention also provides a method for impreving the strength and machinability of doughs and the volume, softeness and crumb structure of bread and other baked products. The present sequence is a PCR primer used to sequence lipase (Liph) gene. This primer is used to illustrate the method of the invention.

Preparing flour dough for preparing baked products, by adding an enzyme that hydrolyses glycolipid and phospholipid, but not triglyceride and/or 1-monoglyceride, to dough components and mixing dough components

Disclosure, Page 106, 107pp; English.

This invention relates to a method of detecting the onset or presence of sporadic basal cell carcinoma (BCC) in an animal. The method involves measuring the level of Glil in a sample of skin. Glil levels above basal or normal indicate the presence or onset of sporadic basal cell carcinoma. Glil is a zinc finger transcription factor down stream of carcinoma. Glil is a zinc finger transcription factor down stream of signal transduction. Glil in turn can induce Shh expression in an auto regulatory manner. There are links between ectopic expression of the Glil gene and the development or onset of BCC. The method is useful for detecting the onset or presence of sporadic basal cell carcinoma, particularly in detecting skin cancer. The primer is used in the method ting the onset or presence of skin cancer, particularly sporadic cell carcinoma, comprises measuring the level of Glil in the Disclosure; Column 8; 21pp; English. Cell comprising exogenous nucleic acid inducing tyrosine hydroxylase expression useful for treating catecholamine-related diseases such as Parkinson's disease, manic depression and schizophrenia

Example 1; Page 20; 68pp; English

The present invention describes the rat Nurrl coding and protein sequences. The Nurrl protein is involved in the induction of tyrosine hydroxylase expression in adult rat-derived hippocampal progenitor cells. The Nurrl gene and protein can be used in the treatment of catecholamine-related diseases such as Parkinson's disease, manic depression and schizophrania. They can also be used to induce tyrosine hydroxylase expression and identify tyrosine hydroxylase related deficiencies, which are linked to the same diseases. The present sequence is a PCR primer used in a method to differentiate adult neural progenitor 8888888888888

Transgenic animals useful as disease models, e.g. for cancer

Example 1; Page 20; 44pp; English

This sequence represents a PCR primer for the mouse Shh gene.

The invention relates to a transgenic non-human animal (A) whose cells contain a non-viral regulatory DNA sequence (I) (e.g. an upstream activating sequence) linked to a recombinant hedgehog gene (II), which was introduced into the mammal, or its ancestor, at an embryonic stage. Bigenic animals (A'), derived from (A) by introducing a transcriptional cativating sequence (TAS), are useful as models of disease, particularly cancer (of breast, skin, prostate, kidney, lung, or central nervous system, also primitive neuroectodermal tumours and medulloblastomal.

Particularly they are used to assess the effect of misexpression of target genes on signalling pathways involving hedgehog proteins (HP) (e.g. altered vascularisation, regulation of brain size, density and e.g. altered vascularisation, regulation of brain size, density and cellular concentration etc.), and for assaying for a temporal requirement for HP in disease progression (particularly of cancers and autoimmune disease). The animals can be used to screen for potential therapeutic

producing neuroectoderm cells. It is also useful for producing differentiated or partially differentiated cells from neural ectoderm cells. The method can is also useful for maintaining neuroectoderm cells in vitro in homogeneous cell populations. It can also be used for producing genetically modified neuroectoderm cells. The cells can be used in the treatment of neuronal diseases, including Parkinson's disease, Huntington's disease, 1900somal storage diseases, multiple sclerosis, also be used for preparation of tissue or organs for transplant. Neural orset cells produced by the method are useful for the treatment of spinal cond discorders and Schwann cells produced by the method are useful for the treatment of spinal cond discorders and Schwann cells produced by the method are useful for the section of the conditions.
                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The specification describes novel monomeric compositions which are substituted quinoline or quinazoline-based structures capable of hydrogen bonding specifically with interstrand purine-pyrimidine pairs in a double stranded Watson-Crick DNA molecule to form a triple-helix. The present sequence appears in the specification. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New substd. quinoline and quinazoline cyds. - are monomers for triple helix-forming oligo:nuclectide analogues useful e.g. for treating tumours or viral infection

Human Desert hedgehog protein - and corresponding DNA and monoclonal antibody

3xample 1-4; Page 10; 39pp; English.

clone (see AAV62396) coding for movel human Desert hedgehog protein (see AAV69596). It was used with an antisense primer (see AAV62411) in a first-step PCR amplification of human leukaemia plasma cell line ARH-77 (ATCC CRL-1621) cDNA in a modified PCR method of This sense primer corresponds to nucleotides 460-479 of a cDNA

3'RACE. 2 Subsequent PCR amplifications (see AAV62423-26) yielded a cDNA clone (see AAV6239) encoding a C-terminal fragment (see AAM79599) of the novel human Desert hedgehog protein. Nucleotide sequences (see AAV6293-59) encoding mature and precursor forms (see AAW79593-95) of human Desert hedgehog are claimed. The Desert hedgehog DNA, protein and a claimed monoclonal antibody can be used in to eludidate hereditary morphological abnormalities in humans to establish their treatments and diagnoses.

```

This sequence represents a PCR primer for the Shh gene, used within the scope of the invention. The invention relates to a method for producing eneuroectoderm cells (1) comprises: (a) providing a source of early primitive ectoderm—like (EPL) cells and a neural-inducing conditioned medium (CM) or extract of it; and (b) contacting the EPL conditioned medium (CM) or extract for a time sufficient to generate controlled differentiation to (1). The cells or partially differentiated progeny are useful in human, or animal cell therapy, transgenic animal production, human or animal gene therapy, the screening of pharmaceutical that induce a biological response in neuroectoderm cells or their partially differentiated progeny and evaluation of biological molecules that direct differentiation of neural cells. The method is useful for Producing neuroectoderm cells for treatment of Parkinson's and Alzheimer's and for transplantation comprises culturing early primitive ectoderm-like cells in conditioned medium -Example 3; Page 41; 91pp; English. WPI; 2001-432908/46.

Foetal cells can
                                                                                                                            In the example, Fragile X Chromosome is identified in amniocytes and in peripheral blood mononuclear cells. The 5' aminohexyl oligos is coupled to the fluorescent dye fluorescenin. When an amplification of the CGG DNA fragment (of the X chromosome in Xq27.3) is present, there is an increase in the intensity of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Method for distinguishing foetal cells from adult cells in blood -based on amplification and detection of mRNA selectively expressed in foetal cells
                                                 Identifying foetal cells in samples contg, maternal cells - used for monitoring foetus status, identifying sex or detecting genetic abnormalities or viral infection
                                                                                                                                                                                                                                                                        Length 25;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                               Probes (AAQ55857-873) detect regions of 3 fragments of the HUMGLBN gene (AAQ64058). Bases 1-91 correspond to bases 2179-2269 of HUMGLBN, bases 92-314 are from 3392-2615 of HUMGLBN and bases 315-443 are from 3502-3630 of HUMGLBN.

The probes (AAQ55854-55) were used as control, positive and negative genetic testing probes. Probe (AAQ55856) was used to detect the fragile X condition (Example 14)

This invention relates to a method of detecting the onset or presence of sporadic basal cell carcinoma (BCC) in an animal. The method involves measuring the level of Gili in a sample of skin. Gili levels above basal carcinoma. Gili is a zinc finger transcription factor down stream of escreted sonic hedgehog (shh) activation in a cascade of cytoplasmic signal transduction. Gili in turn can induce sh expression in an auto regulatory manner. There are links between ectopic expression of the devalopment or onset of BCC. The method is useful for detecting the onset or presence of sporadic basal cell carcinoma, particularly in detecting skin cancer. The presence represents a PCR primer specific for human Shh cDNA. The primer is used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting the onset or presence of skin cancer, particularly sporadic basal cell carcinoma, comprises measuring the level of Glil in the

This invention relates to a method of detecting the onset or presence of sporadic basal cell carcinoma (BCC) in an animal. The method involves measuring the level of Gill in a sample of skin. Gill levels above basal or normal indicate the presence or onset of sporadic basal cell carcinoma. Gill is a zinc finger transcription factor down stream of secreted sonic hedgehog (shh) activation in a cascade of cytoplasmic signal transduction. Gill in turn can induce Shh expression in an auto regulatory manner. There are links between ectopic expression of the Gill gene and the development or onset of BCC. The method is useful for particularly in detecting skin cancer. The present sequence represents a PCR primer specific for human Shh cDNA. The primer is used in the

cells. The method is useful for culturing undifferentiated ES cells to form differentiated neuronal cells which are useful for treating a neurological disorder, especially Parkinson's disease in a patient. A gene product such as tyrosine hydroxylase, nerve growth factor (NGF), brain derived neurotrophic factor (BDNF), bFGF, glial derived growth factor (GDNF) NT-3, and NT-4/5 can be introduced into a brain of a subject. The method is useful for culturing dopaminergic, cholinergic subject. The method is useful for culturing dopaminergic, cholinergic serotonergic neuronal cells. The differentiated neuronal cells are useful for treating neurological disorders such as Huntingforn's disease, Alzaheimer's disease, multiple solerosis, severe selzure disorders including epilepsy, familial dysautonomia as well as injury or trauma to the nervous system such as neurotoxic injury or disorders of mood and chenion such as neurotoxic injury or disorders of mood and such as stroke and CNS disorders resulting from aging. Assays are useful for the nervous system such as neurotoxic injury or disorders of mood and companies of neuronal cells and to screen for antagonist or agonist of dopamine or serotonin. Call cultures comprising 5%-85% neurons which comprise 20-40% dopaminergic neurons and 1-3% astrocytes are useful for studying the mechanism of neurotransmitter synthesis and release, particularly for serotonin and dopamine, neuronal cell survival, and the electrophysiochemical properties of differentiated neuronal cells. Sequences AAIG692-721 represent genes, used for examining the Squeen of Experigic PCR primers for CNS and dopaminergic specific regulatory genes, used for examining the

New nucleic acid encoding oncogenic human hedgehog protein - useful for, e.g. treatment and diagnosis of cancer and diseases involving cell proliferation or differentiation

Example; Page 23; 47pp; English

```
ô
      This human sonic hedgehog (SHH) gene exon 2-specific primer was used with another exon 2-specific primer (see AAV18410) in a PCR amplification of genomic DNA from 34 independent basal cell carcinomas, 14 medulloblastomas and 6 breast carcinomas. PCR primers (see AAV18407-08 and AAV18411-12) specific for SHH exons 1 and 3 were also used. PCR products were subjected to single strand conformation polymorphism analysis. 2 Mutations (see AAV18403 and AAV18404) were identified in the SHH gene from 4 human cancers. The mutated SHH genes and the encoded polypeptides (see AAV18403 and AAV18716) can be used in methods for the trearment and diagnosis of cancer and other diseases involving cell proliferation or

New nucleic acid encoding oncogenic human hedgehog protein - useful for, e.g. treatment and diagnosis of cancer and diseases involving cell proliferation or differentiation

Example; Page 25; 47pp; English.

oDNA derived from human epidermal keratinocytes was amplified by 3-stage nesting using sonic hedgehog (SHH) gene stage 1 primers (see AAV18413 and AAV18414), stage 2 primers (see AAV18415 and AAV18415). The PCR product and stage 3 primers (see AAV18417 and AAV18415). The PCR product was identified as authentic SHH. A single somatic mutation (see AAV18403) of the SHH gene was found in cancers arising from 3 different tissues in independent patients. Another mutation (see AAV18404) was identified in another cancer. The mutated SHH genes and the encoded polypeptides (see AAW48735 and AAW48736) can be used in methods for the treatment and diagnosis of cancer and other

The present sequence is a PCR primer for the sonic hedgehog gene (SHH). It was used in reverse transcription PCR to determine expression patterns of the SHH gene in cultured cells. These cells had been grown in low oxygen conditions, and had differential to form various types of neuronal cell. The different expression patterns can be used to determine which set of conditions promotes the differentiation of each type of neurone. The different cell types can be used for tissue transplantation, to treat disporders such as stroke, brain and spinal cord injury, Alzheimer's disease, Huntington's disease, other neurodegenerative disporders. Parkinson's disease, neurological disorders and

ö New simple sequence repeats having 2 or more tandemly repeated motateotide core elements isolated from ryegrass and fescue, useful selecting of genes in grass or cereal breeding or profiling grass ocereal species varieties

Claim 6; Page 51; 72pp; English.

The invention relates to a substantially purified or isolated nucleic acid (1) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primer suitable for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and

identifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing variation between SSR varieties and testing the purity of grass or cereal seed batches by assessing variation within seed batch of an SSR. The SSRs may be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal seed batches, and for DNA profiling to establish the distinct identity, uniformity and/or stability of a cultivar. The present sequence is a ryegrass or fescue SSR.

Culturing cells such as neuronal cells for use in treating neurological disorders, comprises generating embryoid bodies from undifferentiated embryonic stem cells, selecting precursor cells, expanding and them differentiating X A X B X X

Example 10; Page 41; 66pp; English.

The invention provides a method of culturing cells. The method involves expanding a culture of undifferentiated embryonic stem (ES) cells, generating embryoid bodies (EB), culturing the bodies to select for central nervous system (CNS) precursos (PC), culturing PC in an expansion medium comprising a neurologic factor, and differentiating and culturing the expanded PC to form a culture of differentiated neuronal

```
A method for increasing the differentiation of undifferentiated central nervous system (CNS) cells in culture. This novel method involves culturing the cells in low ambient oxygen conditions. Differentiated CNS cells can be used to treat neurodegenerative diseases such as Parkinson's disease. In order to determine the differentiated phenotype messenger RNA levels can be messured using reverse transcription PCR. This involves using PCR primers specific to certain genes. The present sequence is the forward PCR primer used to monitor the message level of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a PCR primer for the Shh gene, used within the scope of the invention. The invention relates to a method for producing neuroectoderm cells (I) compises: (a) providing a source of early primitive ectoderm cells (I) compises: (a) providing a source of carly primitive ectoderm cells (I) cells and a neural-inducing conditioned medium (CM) or extract of it; and (b) contacting the EPL cells with the CM or extract for a time sufficient to generate controlled differentiation to (I). The cells or partially differentiated progeny are useful in human, or animal cell therapy, transgenic animal production, human or animal gene therapy, the screening of pharmaceutical that induce a biological response in neuroectoderm cells or their partially differentiation of neural cells. The method is useful for producing neuroectoderm cells. It is also useful for producing neuroectoderm cells. It is also useful for producing neuroectoderm cells. It is also useful for producing genetically modified neuroectoderm cells can be used for neuroenal diseases, including Parkinson's disease, thurtington's disease, lysosomal storage diseases, multiple sclerosis, commony and behavioural diseases, including Parkinson's disease, the method can also be used for preparation of tissue or organs for transplant. Neural cord multiple sclerosis also be used for preparation of tissue or organs for transplant. Neural cord multiple sclerosis cord diseaset and Schwann cells produced by the method are useful for the transment of multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The present invention describes a method for cartilage differentiation by culturing capable of differentiating into cartilage under hypoxic conditions. Also described: (1) a method for producing cartilage cells or cartilage. Also described: (1) a method for producing cartilage cells or cartilage, (3) a method for preventing or treating joint diseases by transplanting an effective amount of the cartilage cells or cartilage. CC cartilage for producing preventives or transplanting an effective amount of the cartilage cells or cartilage. (4) the use of the cartilage cells or cartilage for producing preventives or cartilage differentiation or joint diseases by using any of the culture methods; (5) a method for screening preventive or inhibitors of cartilage differentiation or joint diseases by using my of the culture methods; (8) a method for screening preventives or remedies for joint diseases by using method for acreening preventives or remedies for joint diseases; (9) a method for preventives or remedies for joint diseases; (9) a method for preventives or remedies for joint diseases; (9) a method for preventives or remedies for joint diseases. The produced cultured cartilage calls or cartilage can be used in cartilage transplantation, studying genes or proteins relating to diseases. The produced cultured cartilage cells or cartilage can be used in cartilage transplantation, studying genes or proteins relating to diseases of bone fracture, methods; or their treatment, including carbinates or subtributes.
                                                                                                                                                                                                      Culture method for cartilage differentiation from cells under hypoxic conditions into cartilage cells applicable in cartilage transplantation, and studying genes or proteins relating to joint diseases

Mus musculus

The invention relates to use of a modulator of a Hedgehog signalling pathway or a modulator of a target of the pathway in the preparation of a medicament for treating Tecll mediated disease or infection or a disease or disorder associated with increased or decreased T-cell apoptosis and for modification of (peripheral) T-cell activation or proliferation or T-cell apoptosis, and for modulation of the Notch signalling pathway in immune cells. The modulator is useful for treating cancer of the breat, prostate or ovary, lymphomas and carcinomas, autoimmune diseases such as systemic lupus erythematosus, multiple sclerosis and diabetes, inflammatory diseases such as otherosclerosis and diabetes, inflammatory diseases such as etherosclerosis and psoriasis, viral inflammatory diseases such as therosclerosis and psoriasis, viral infections such as AIDS and herpesviruses, genetic immunodeficiencies, neurodegenerative diseases such as Alzeimer's disease and Parkinson's disease, myclodysplastic syndromes such as aplastic anaemia, ischaemic injuries such as mycoardial infarction, toxin-induced diseases such as calchara. This sequence represents a reverse transcriptase PCR (RT-PCR) primer used in the scope of the Use of a modulator of Hedgehog signalling pathways for treating T-cell mediated disease or infection and diseases associated with increased or decreased T-cell apoptosis and T-cell proliferation -Champion BR; Example 11; Page 110; 154pp; English. The invention relates to a replicase complex comprising a hepatitis C virus (HCV) MSSB replicase protein, a linear nucleic acid template and a complementary nucleic acid primer which is annealed to the 3' terminus of the template, where the template is at least three nucleotides and the primer is two or three nucleotides, and the template and primer do not form a stable duplex in solution in the absence of the HCV MSSB protein. The complex is useful for detecting HCV replicase activity and permits establishment of sensitive KNA-dependent RNA polymerase assays to screen and evaluate antiviral inhibitors and to improve the specificity and efficacy of the inhibitors. The complex is also useful in the development of HCV NSSB-catalysed nucleotide incorporation and investigation of mechanistic inhibitors for mis-incorporation or chain termination. Specifically, the short RNA template and primer pairs are useful in screening assays which are used for determining kinetic, thermodynamic and mechanistic properties of NSSB replication and ultimately in the development of inhibitors of NSSB replication and ultimately in the replicase activity may be used for developing anti-HCV pharmaceuticals. Sequences ABK99271-ABK99296 represent HCV NSSB replicase RNA synthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                                                                                                                                         Novel replicase complex comprising hepatitis C virus NSSB replicase, a 3 nucleotide-long template to which a 2 nucleotide-long primer is annealed, and template and primer which do not form a stable duplex in the absence of HCV NSSB -

```
The invention relates to the use of an active agent stimulating the expression and/or function of serum response factor (SRF), SRF variants and/or members of the SRF signal transduction pathway in eukaryotic cells for the preparation of a therapeutic drug or a pharmaceutical composition for the treatment of disturbances or illness such as tumour invasion, tumour metastasis, auto-immune diseases, disturbances of would healing, lymphocyte homing and disturbances of immune defense mechanisms that are linked with SRF-crelated cellular malfunctions. Pharmaceutical compositions of the invention are used in treating gene, which include formation of convention are used in treating gene, which include formation of diseases like metastatic cancer which is influenced by the gene cupant and various hypoglycaemias. The present sequence is Shh specific reverse transcription PCR (RT-PCR) primer used in the invention.
Use of active agent stimulating expression of serum response factor, its variants or components of signal transduction pathway of factor seukaryotic cells, for treating disturbances or illness e.g. cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Osteopathic; antirheumatic; antiarthritic; cytostatic; cartilage; cartilage differentiation; joint disease; bone fracture; myeloma; osteoporosis; rheumatoid arthritis; human; Indian hedgehog;

Novel isolated hedgehog fusion polypeptide useful for treating neurological conditions such as Alzheimer's disease, Parkinson's disease, Huntington's chorea, amylotropic lateral sclerosis, and multiple sclerosis.

Sxample 1; Page 54; 178pp; English

The present invention relates to hedgehog fusion proteins. Hedgehog proteins are a family of extracellular signalling proteins that regulate various aspects of embryonic development both in vertebrates and in invertebrates. Hedgehog fusion protein is useful for the prophylaxis or treatment of any condition or disease state for which a hedgehog or patched protein constituent is efficacious and in the diagnosis of constituents or conditions of disease states in biological system or specimens and for diagnostic purposes in non-physiological system or specimens and for diagnostic purposes in non-physiological system or specimens and for diagnostic purposes in non-physiological conditions due to injury, aging of nervous system, including Alzheimer's disease, chronic neurodegenerative diseases of the nervous system, including parkinson's adisease, Huntingfon's chorea, amylotropic lateral scherosis and chronic immunological diseases of nervous system including multiple sclerosis and malignant gliomas, medulloblastomas, neuroectodermal tumours and to specifically target medical therapies against cancers and tumours which express the receptor for the protein. The present sequence is an oligonucleotide used in the construction of pubs5 expression plasmid for expressing human sonic hedgehog protein in Pichia pastoris.

The invention relates to new methods for modulating (promoting or inhibiting) angiogenesis in a subject animal using hedgehog polypeptides or its modulators are useful for instances. The hedgehog polypeptide or its modulators are useful for modulating angiogenesis in a subject. The antagonists are useful in the treatment of angiogenesis related disorders such as malignant tumours, teninopathy, macular degeneration, non-malignant tumours, relundurs, returnopathy, macular degeneration, non-malignant unmours, relundurs, osteoarthritis, nosvascular glaucoma, keloids, crohn's disease, ulcerative colitis and psoriasis. The antagonists of the invention are also useful for the treatment of tissue repair, ischaemia, diabetic retinopathy, inflammation, peribheral or central nervous system vascular disease, cachexia and high blood pressure and cholesterol levels for the modulation of ovulation, menetruation, placentation and endometrial lning formation and maintenance; and for the diagnosis of eg. cancer. This polymucleotide sequence represents the DNA of a sonic hedgehog oligonucleotide of the invention. ö vulnerary; vasotropic, antidiabetic; cerebroptotective; immunomodulator; muscular active general; hypotensive; antilipaemic; hedgehog protein; contraceptive; antidifertility; placentation; anglogenesis; retinopathy; malignant tumour; macular depeneration; non-malignant tumour; keloid; rheumatoid arthritis; osteoarthritis; neovascular glaucoma; psoriasis; crohm's disease; ulcerative colitis; tissue repair; diabetic retinopathy; ischaemia; inflammation; peripheral; central nervous system; cachexia; vascular disease; high blood pressure; cholesterol; ovulation; cancer; menstruation; gynaecological; endometrial lining formation; Use of hedgehog polypeptide, its agonists or antagonists for modulating angiogenesis in the treatment of e.g. malignant tumors, retinopathy, macular degeneration, non-malignant tumors, rheumatoid arthritis and gastrointestinal general; antiinflammatory; antiulcer; antipsoriatic; Gaps . 0 Length 29; 0; Indels 1.4%; Score 22; DB 1; 100.0%; Pred. AAA28860-61 form a XHOI-Earl fragment and create the appropriate coding sequence for placing Sonic hedgehog (Shh) adjacent to the alpha factor leader sequence in-frame. The construct was used to produce Shh (N-10) antagonist. The invention concerns Sonic, Desert and Indian HH actor antagonist. The invention concerns Sonic, Desert and Indian HH actor an bind a FH receptor but do not induce a HH-dependent signaling response and methods of producing an antagonist. The antagonists are produced by altering an N-terminal Cys-1 residue of a mature HH polypeptide. When bound to the receptor (packhed!), the isolated antagonist blocks alkaline phosphatase (AP) induction by mature HH protein when tested in an AP assay. The antagonist may be used for treating conditions characterized by over expression or activity of HH polypeptides, such as some basal cell carcinomas, and other human conjugations characterized by over expression or activity of HH polypeptides, such as some basal cell carcinomas, and other human collypeptides, such as some basal cell carcinomas, and other human collypeptides, such as some basal cell carcinomas, and other human collypeptides of the central nervous system. Other uses include control of adult neurons with regard to maintenance, functional performance and aging of normal cells, repair and regeneration in performance and aging of normal cells, repair and regeneration in the send to inhibit hair growth (eg. to treat trichosis and hirsuism) or to prevent hair loss in patients having chemo- or radiation-therapy.
                                                                                                                              Shh; hedgehog; sonic; indian; desert; antagonist; receptor; cytostatic; cerebroprotective; neuroactive; hair growth inhibitor; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method for determining the presence of neoplastic molecular markers in a host, involving the use of neoplastic molecular marker specific reagents to detect such markers and analysing the array of reagents, allowing the identification of the neoplastic disease present. This can be used to determine the best treatment for another, in particular neural cell, lung and prostate tumours. The present sequence is a PCR primer useful for detecting the coding sequences of markers of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; cancer; neoplastic disease; tumour specific marker; cytostatic; transcription factor; PCR; primer; ss.

Determining an analyte in a sample, for generating multiple double stranded nucleic acids, comprises employing a single primer sequence with a nucleobase sequence having affinity to the sequence contained in target nucleic acid

Example 1; Column 14; 25pp; English.

The invention relates to determining an analyte in a sample comprising (a) providing a target mucleic acid comprising a region A, and a sequence B, and a sequence I linked to the 5' terminus of the nucleobase sequence B, and a sequence I linked to the 5' terminus of the nucleobase sequence B is not specific correct to the analyte, and the relation by specifically binds to the analyte, and the relation by specifically binds to the analyte, analyte bound to the target nucleic acid, where the sample, (d) hybridising a parimer to the target nucleic acid, where the prince comprises a nucleobase sequence B', and the nucleobase sequence B' and the nucleobase sequence B' and the nucleobase sequence B' where at least 9 by the prince an uncleobase sequence B', where to produce an elongation product E using the target nucleic acid as a templace contain at least one promiscuous base which is capable of as a templace acid at from the elongation product E, (g) hybridising a further primer which comprises the nucleobase sequence B' to the elongation product E, where the elongation product E sequence B' to the elongation product E, where the elongation of the further primer, (h) elongation product E, where at least 9 c sequence B' to the alongation product E, where at least 0 c sequence B' to the elongation product E' using the elongation product E sequence B' to the target nucleoides where at least 0 c produce an elongation product E' (s) hybridising a further primer of step (g) to produce another elongation product E' (s) hybridising a nucleobase sequence B' (s) to the target nucleic acid or produce another elongation product E' (k) elongation product E (k) from the target nucleic acid or produce another elongation product E' (k) from the target nucleic acid or the product B as a templace and using nucleotides where at least 0 c separating product E (k) from the target nucleic acid or elongation product E' (k) elongation product E' (k) elongation product E' and/or elongation product E' as a measure of the presence or amount

Use of a modulator of Hedgehog signalling pathways for treating T-cell mediated disease or infection and diseases associated with increased or decreased T-cell apoptosis and T-cell proliferation -

Example 11; Page 110; 154pp; English.

The invention relates to use of a modulator of a Hedgehog signalling pathway or a modulator of a target of the pathway in the preparation of a medicament for treating T-cell mediated disease or infection or a disease or disorder associated with increased or decreased T-cell apoptosis and for modification of (peripheral) T-cell activation or proliferation or T-cell apoptosis, and for modulation of the Notch signalling pathway in immune cells. The modulator is useful for treating cancer of the breast, prostate or ovary, lymphomas and carcinomas, autoimmune diseases such as systemic lupus erythmatosus, multiple sclerosis and diabetes, inflammatory diseases such as osteoarthitis and Crohn's disease, proliferative disorders such as atherosclerosis and psoriasis, viral infections such as AIDS and herpesviruses, genetic immunodeficiencies, neurodegenerative diseases such as Alzkainer's disease such as contact as aplastic anaemia, ischemic injuries such as mycoadial infarction, toxin-induced diseases such as cirrhosis and wasting diseases such as contact as eapered at seases such as cirrhosis and wasting diseases such as contact as eapered in the scope of the

The invention relates to use of a modulator of a Hedgehog signalling pathway or a modulator of a target of the pathway in the preparation of a medicament for treating T-cell mediated disease or infection or a disease or disorder associated with increased or decreased T-cell apoptosis and T-cell apoptosis, and for modulation of the Notch signalling pathway in immune cells. The modulation of the Notch signalling pathway in immune cells. The modulation of the Notch signalling pathway in immune cells. The modulation of the Notch signalling pathway in immune cells. The modulator is useful for treating cancer of the breat, prostate or ovary. Lymphomas and carcinomas, autoimmune diseases such as offerearist and diabetes.

Drostate or ovary, Lymphomas and carcinomas, autoimmune disease, inflammatory diseases such as otheroarchitis and grohn's disease.

Drolferative diseases such as atherosclerosis and psoriasis, viral infections such as Alizheimer's disease and Parkinson's disease, myclodysplastic syndromes such as aplastic anaemia, ischaemic injuries such as mycocardial infarction, toxin-induced diseases such as cirrhosis and wasting diseases such as cachexia. This sequence represents a probe used in the scope of the invention.

The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting trandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic repeats. The computational methods (polymorphic repeats in burker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogensemia, spinal and bulbar atrophy and spinocereballar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTS.
                                                                                                                                                                                                                                                                  EST; expressed sequence tag; ss; polymorphic repeat; tandem repeat; polymorphic marker prediction of ubiquitous simple sequences; POMPOUS; Rep-X; human; genetic disease; drug-treatment, Machado-Joseph; Haw River syndrome; Huntington's disease; fragile-X syndrome; Predicticl's ataxis; myotonic dystrophy; hyperandrogenaemia; spinal atrophy; bulbar atrophy; spinocerebellar ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying a candidate polymorphic repeat within a coding sequence, for understanding or treating genetic disease, comprises detecting tandem repeats in a target coding sequence and scoring the repeats for polymorphic probability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

cotropic, neuroprotective, anticonvulsant, antiarrhythmic and cytostatic activities. (I) induces the expression of the BMP-2 and -4 genes, and of the Hoxd gene. (I) induces the expression of the BMP-2 and -4 genes, and of neuronal cells and survival of the differentiated cells, specifically dopaminergic or motor neurons, proliferation of chondrocytes, and proliferation, differentiation and/or survival of mesodermal or cetodermal cells, either in cell cultures (particularly for preparation of transplants) or therapeutically; (ii) for detecting loss of response, in tissues or, to hh proteins; (iii) in drug screening (to identify) (ant) agonists, useful e.g. for inhibition of spermatogenesis); and (iv) for isolation of cognate receptors. (I) may be used therapeutically to treat e.g. injuries/defects in the central or peripheral nervous systems, arrhythmias caused by nerve degenration; immunological disorders of the nervous system, e.g. multiple sclerosis; neoplastic and hyperplastic altherations in the central nervous system, also to promote attachment of prosthases. The present sequence respectate a PCR primer for human sonic hedgehog (Shh), which is used in the exemplification of the present Sequence 24 BP; 6 A; 5 C; 11 G; 2 T; 0 other; invention.

This human sonic hedgehog (SHH) gene exon 2-specific primer was used with another exon 2-specific primer (see ARV18406) in a PCR using DNA from human bacterial artificial chromosome (BAC) DNA pools. Only pools comprising a BAC that contains the sequence tag 

Gaps defined by the primer pair will yield an amplification product. The process was continued until a single positive BAC was identified. The positive clone, BACSTORAI7, was digested with restriction enzymes and ligated into vectorette linkers. Mutations (see AAV18403 and AAV18404) have been identified in the SHH gene in human cancers. The mutated SHH genes and the encoded polypeptides (see AAW48735 and AAW48736) can be used in methods for the treatment and diagnosis of cancer and other diseases involving cell proliferation or differentiation. Human Desert hedgehog protein - and corresponding DNA and monoclonal This sense primer is based on the human Sonic hedgehog gene. It was used with an antisense primer (see AAV62419) in the PCR amplification of human A549 (ATCC CRL-185) cDNA. A recombinant DNA clone (see AAV62400) encoding human Sonic hedgehog protein (see AAW79500) was obtained. The protein was expressed in E. coli cells and used to raise monoclonal antibodise that showed specificity for both Sonic hedgehog and for novel human Desert hedgehog proteins. DNA sequences (see AAV62393-95) encoding mature and precursor forms (see AAW7953-95) of human Desert hedgehog are claimed. The Desert hedgehog are claimed. The Desert used in to elucidate hereditary morphological abnormalities in . 0 88 Sonic hedgehog; Desert hedgehog; human; HuDHH; PCR; primer; DB 1; Length 25; Indels Sequence 25 BP; 4 A; 8 C; 8 G; 5 T; 0 other; Human Sonic hedgehog gene sense PCR primer. 1.5%; Score 23.4; Dest Local Similarity 96.0%; Pred. determining whether a patient is at the risk of disorder characterised by unwanted cell proliferation or aberrant control of differentiation. The hedgehog proteins or mimetics can be used to induce foetal neurons especially neurons term cells in intracerebral grafting. The protein or its mimetic can be used in the treatment of neurological conditions e.g. injury to nervous system, ischaemia resulting from stroke, Alzheimer's disease, Parkineon's disease, Euntington's chorea, amyotrophic lateral sclerosis (ALS) and multiple sclerosis. The present DNA sequence is forward PCR primer which is used for amplifying human sonic hedgehog (Shh) gene.

```

PCR primers AAC87097-98 were used to amplify cDNA encoding a hedgehog related-protein. The specification describes a sonic hedgehog protein (Shh), a desert hedgehog protein (Dh), and an indian hedgehog protein (Ihh). The hedgehog polymucleotides are useful in diagnostic, in antisense therapy and in therapeutic assays for detecting and treating disorders involving, e.g., aberrant expression of vertebrate hedgehog homologue. Hedgehog polypeptides are useful therapeutically to enhance

(I) binds to a natural patched receptor. Specifically claimed example of (I) are given in ABB79132 and ABB79134 to ABB79138. (I) has antiparkinsonian,

The present invention relates to assay for screening compounds that potentiate or inhibit binding of hedgehog polypeptide to naturally occurring patched receptor. The hedgehog polypeptide to naturally signals produced by embryonic patterning centres, and are involved in the formation and maintenance of ordered spatial arrangements of differentiated tissues in vertebrates, both adult and embryonic. The proteins can be used to generate and/or maintain an array of different to a method for modulating growth, differentiation or survival of a mammalian cell (e.g. neuron, testicular cell) responsive to hedgehog amonists and antegonists can be used in cell culture techniques to enhance survival and maintenance of neurons and various vertebrate organogenic pathways. The hedgehog gene is useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; Sonic hedgehog; Shh; morphogenic signal; neuron; embryonic patterning; cell culture; cell differentiation; ischaemia; cell prolliferative disorder; intracerebral grafting; Huntington's chorea; neurological disorder; Alzheimer's disease; Parkinson's disease; amyotrophic lateral sclerosis; ALS; multiple sclerosis; PCR primer; ss.
differentiated, neuronal cells, and for promoting proliferation, survival or differentiation of mesenchymal, endodermal or ectodermal tissue, particularly chondrocytes, or testicular germ line cells. Sequences AAH76132-133 represent PCR primers for amplifying a human Shh DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Screening compounds that potentiate or inhibit binding of hedgehog polypeptide to naturally occurring patched receptor, comprises contacting polypeptide with receptor and test compound, and detecting change in binding -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to nucleic acids encoding hedgehog proteins selected from sonic hedgehog (Shh), indian hedgehog (Ihh), desert hedgehog (Dh) polypeptides. The hedgehog genes are involved in the formation of ordered spatial arrangements of differentiated tissue in vertebrates. The nucleic acid sequences are useful for producing hedgehog proteins, used for promoting differentiation of, or survival of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel nucleic acid encoding a hedgehog polypeptide, used to produce the polypeptide, which is used to promote proliferation, survival, and/or differentiation of neuronal and mesodermal tissue -
                                                            This human sonic hedgehog (SHH) gene exon 2-specific primer was used with another exon 2-specific primer (see AAV18406) in a PCR using DNA from human bacterial artificial chromosome (BAC) DNA pools. Only pools comprising a BAC that contains the sequence tag defined by the primer pair will yield an amplification product. The process was continued until a single positive BAC was identified. The positive clone, BAC270A17, was digested with restriction nerymes and ligated into vectorette linkers. Mutations (see AAV18403 and AAV18404) have been identified in the SHH gene in human cancers. The mutated SHH genes and the encoded polypeptides (see AAV48735 and AAV48404) have be used in methods for the treatment and diagnosis of cancer and other diseases involving cell proliferation or differentiation.

The sequences given in AAQ91654-57 are primers which were used to homologous to a Drosophila hedgehog protein (AAR77337). The human sequence was isolated by screening of human genome DNA by nested polymerase chain reaction using these primers, followed by use of a clone to screen a human fetal lung 5'-stretch plus cDNA bibrary in phage lambdagt10. A clone has been isolated from a phage P1 library by polymerase chain reaction, using primers SHHF (AAQ91654) and SHR (AAQ91655), to give clone SHHP1. A 2.5-kb EcoRI CA repeat fragment is and primers SHHGRF (AAQ91655) and SHRC (AAQ91655), and sHRP (AAQ91655), and sHRP (AAQ91655). Probes and primers Gerived from the sonic hedgehog sequence may be used as diagnostic agents for neuromuscular, autonomic or central nervous system disorders, and the gene may also be used in gene therapy. Antibodies generated from the encoded protein may be used as therapeutic or research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid encoding oncogenic human hedgehog protein - useful for, e.g. treatment and diagnosis of cancer and diseases involving cell proliferation or differentiation
                                                                                  Hedgehog-like protein(s) and nucleic acid(s) encoding them - useful to treat degenerative nervous system disorder(s) and in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sonic hedgehog; SHH gene; HH gene; tumorigenesis; oncogenesis; basal cell carcinoma; breast cancer; medulloblastoma; tumour; cell proliferation; cell differentiation; diagnosis; therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human mutated sonic hedgehog (SHH) gene exon 2 PCR primer,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to novel polymer conjugates of hedgehog proteins which have increased bicavailability. The hedgehog proteins are conjugated to a non-naturally-occurring polymer comprising a polyalkylene glycol group, with the proviso that the polymer is not conjugated to the residues of the hedgehog protein. The hedgehog protein. The hedgehog protein. The hedgehog protein. The hedgehog (bhh) protein. The invention also relates to methods of a hedgehog fusion protein. The invention also relates to methods of a hedgehog fusion protein. The invention also relates to methods of the position and/or type of modification have on the activity of the protein. The hedgehog polymer conjugates may be used in the management of various medical conditions including various nectivity of the protein. The hedgehog polymer conjugates may be used in the management of various medical conditions including various necroses. In particular, they may be used to prevent preventing or amaliorate neurodegenerative disorders (e.g., Parkinson's disease, and cancers. In particular, they may be used to prevent preventing or amaliorate neurodegenerative conservational diseases of the neurological disease, neurological injury and traums; immunological diseases, neurological injury and traums; immunological diseases, neurological injury and traums immunological diseases of the neurous system (e.g., multiple sclerosis); stroke, and malignant gllomas, medulloblastomas and may result in increased half-life, altered tissue distribution (such as time, increased stability in solution, protection from proteiny to remain in the vasculature for prolonged periods may allow a hedgehog protein in powder form or orse the blood-brain barrier, and an increased thermal stability would be an advantage when formulating the headenon or he present egedenic ergonesents and the presents and consents and conse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nedgehog protein in powder form.                                  The present invention relates to a method for determining the presence on neoplastic molecular markers in a host, involving the use of neoplastic molecular marker specific reagents to detect such markers and analysing the array of reagents, allowing the identification of the neoplastic disease present. This can be used to determine the best treatment for cancers, in particular neural cell, lung and prostate tumours. The sequence is a PCR primer useful for detecting the coding sequences of markers of the invention.
                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to novel polymer conjugates of hedgehog proteins which have increased bloavailability. The hedgehog proteins are conjugated to a non-naturally-occurring polymer comprising a polyalkylene cypycol group, with the proviso that the polymer is not conjugated to the protein are conjugated to the protein used in the conjugate may be a wild-type or mutant Sonic hedgehog protein. The hedgehog protein. The hedgehog protein. The hedgehog conjugate may be a wild-type or mutant Sonic hedgehog configuration protein. The invention also relates to methods of a hedgehog functionally important regions of a protein by modifying accessible amino acid side chains, and determining the effect of the position and/or type of modification have on the activity of the protein. The hedgehog polymer conjugates may be used in the management of various medical conditions including various neurological disorders, and autoinmune diseases, and cancers. In particular, they may be used to prevent preventing or ameliorate neurodegenerative disorders (e.g., Parkinson's disease, Huntington's disease, Alzheimer's disease, and anotominate diseases, menological disease, intended in injury and trauma; immunological diseases, intended to prevent in a confidence of the nervous system (e.g., multiple sclerosis); stroke; and malignant gliomas, medulloblastomas and neuroscodemal tumours. The modifications made to the hedgehog protein may result in increased half-life, altered tissue distribution (such as an improved abblity to stay in the vasculture for longer periods of time), increased stability in solution, protection from proteolytic degradation, or reduced immunogenicity. In particular, the ability to remain in the vasculture for prolonged periods may allow a hedgehog protein of the invention to cross the bload-brain barrier, and an increased thermal stability would be an advantage when formulating the human configuration is requence represented and in a protein of the invention to cross the bload-brain barrier, and an increased the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          log protein in powder form. Modified hedgehog protein, useful in the treatment of Parkinson' disease and Huntington's chorea, comprises a polymer containing polyalkylene glycol group linked to any residue other than the N-terminal and lysine residues.

Example 6; Page 77; 157pp; English.

The invention relates to novel polymer conjugates of hedgehog proteins which have increased bioavailability. The hedgehog proteins are conjugated to a non-naturally-occurring polymer is not conjugated to the original polymer comprising a polyalkylene glycol group, with the proviso that the polymer is not conjugated to the original solution with the proviso that the polymer is not conjugated to the hedgehog protein. The hedgehog protein. The hedgehog protein also relates to methods of a hedgehog (lasion protein.) The invention also relates to methods of a hedgehog (lasion protein.) The invention also relates to methods of a hedgehog (lasion protein.) The invention also relates to methods of the position and/or type of modification have on the activity of the protein. The hedgehog polymer conjugates may be used in the management of various medical conditions including various neurological disorders.

Continuates of the preventing or ameliorate neurodegenerative disorders (e.g., Parkinson's disease, and cancers.) Nathelmer's disorders (e.g., Parkinson's disease, neurological hinury and trauma; immunological diseases, and cancers. In particular, they may be used to prevent preventing or ameliorate neurodegenerative concernated meurological disease, neurological hinury and trauma; immunological diseases of the nervous system (e.g., multiple sclerosis); stroke; and malignant gliomas, medulloblastomas and may result in increased half-life, altered tissue distribution (such as an increased ability to stay in the vasculature for longer periods of time), increased stability in solution, protection from proteolytic change in the vasculature for longer periods of the remaining the vasculature for longer periods of the remaining the vasculature for longer proteolytic changer in the vasculature for longer proteolytic change in the vasculature for longer proteolytic change in the vasculature for longer proteolytic changes of the protein of the inventor of the independent of the protein contain the headendent protein contain t of the invention to cross the blood-brain barrier, and an ed thermal stability would be an advantage when formulating the gretein in powder form. The present sequence represents a Sonic hedgehog mutagenic primer used in an exemplification of hedgehog protein

Modified hedgehog protein, useful in the treatment of Parkinson' disease and Huntington's chorea, comprises a polymer containing opolyalkylene glycol group linked to any residue other than the N-terminal and lysine residues -Example 6; Page 77; 157pp; English. 99US-0137011 99US-0149016 Taylor F, WPI; 2001-049927/06. (BIOJ ) BIOGEN INC. Pepinsky RB, 01-JUN-1999; 13-AUG-1999;

The invention relates to novel polymer conjugates of hedgehog proteins which have increased bloavailability. The hedgehog proteins are conjugated to a non-naturally-occurring polymer comprising a polyalkylene glycol group, with the proviso that the polymer is not conjugated to the N-terminus, or to lysine residues of the hedgehog protein. The hedgehog protein used in the conjugate may be a wild-type or mutant Sonic hedgehog (Shh). Indian hedgehog (Shh) or Desert hedgehog (Shh) protein, or may be a hedgehog fusion protein. The invention also relates to methods of defining and mapping functionally important regions of a protein by

modifying accessible amino acid side chains, and determining the effect the position and/or type of modification have on the activity of the protein. The hedgehog polymer conjugates may be used in the management various medical conditions including various neurological disorders.

Inflammatory and autorimmune diseases, and cancers. In particular, they may be used to prevent preventing or amaliorate neurological disease, and seases, neurological injury and trauma; immunological disease, neurological hipty and trauma; immunological diseases, neurological injury and trauma; immunological diseases of the nervous system (e.g., multiple sclerosis); stroke; and malignant gliomas, medulloblastomas and recensed harm turnours. The modifications made to the hedgehog protein may result in increased half-life, altered tissue distribution (such as improved ability to stay in the vasculature for longer periods of time), increased stability in solution, protection from proteclytic degradation, or reduced immunogenicity. In particular, the ability to remain in the vasculature for prolonged periods may allow a hedgehog protein of the invention to cross the blood-brain barrier, and an increased thermal stability would be an advantage when formulating the human pooler for prolonged periods represents a processic periods of the modernian may are represented the presents and an increased thermal stability would be an advantage when formulating the human pooler for prolonged periods represents a process the present sequence represents and an analysis of the present seq human Sonic hedgehog mutagenic primer used in an exemplification of the

Modified hedgehog protein, useful in the treatment of Parkinson's disease and Huntington's chorea, comprises a polymer containing a polyalkylene glycol group linked to any residue other than the N-terminal and lysine residues.

Example 2; Page 67; 157pp; English.

The invention relates to novel polymer conjugates of hedgehog proteins which have increased bloavailability. The hedgehog proteins are conjugated to a non-naturally-occurring polymer comprising a polyalkylene collyment of a non-naturally-occurring polymer comprising a polyalkylene glycol group, with the proviso that the polymer is not conjugated to the protein used in the conjugate may be a wild-type or mutant Sonic hedgehog protein. The hedgehog protein. The hedgehog protein in the conjugate may be a wild-type or mutant Sonic hedgehog claiming and mapping functionally important regions of a protein by modifying accessible amino acid side chains, and determining the effect defining and mapping functionally important regions of a protein by confitying accessible amino acid side chains, and determining the effect confitying accessible amino acid side chains, and determining the effect deprivation and/or type of modification have on the activity of the protein. The hedgehog polymer conjugates may be used in the management of various medical conditions including various neurological disease, and cancers. In particular, they may be used to prevent preventing or ameliorate neurodegenerative disorders (e.g., Parkinson's disease, Huntington's disease, Alzheimer's disease, associated neurological disease, menological disease, murological injury and trauma; immunological disease, menological injury and trauma; immunological disease, menological conserved ability to stay in the vasculature for longer periods of time, increased stability in solution, protection from proteolytic degradation, or reduced immunoganicity. In particular, the ability to remain in the vasculature for prolonged periods may allow a hedgehog protein of the invention to cross the blood-brain barrier, and an increased thermal stability would be an advantage when formulating the human sonic hadrent mit areas to remain in the vasculature for prolonged periods in a personic sequence respectation of the human sonic print of the management of the management nog protein in powder form. The present sequence represents a Sonic hedgehog mutagenic primer used in an exemplification of the

Modified hedgehog protein, useful in the treatment of Parkinson's disease and Huntington's chorea, comprises a polymer containing a polyalkylene glycol group linked to any residue other than the Example 6; Page 77; 157pp; English. polyalkylene glycol group linke N-terminal and lysine residues

The invention relates to novel polymer conjugates of hedgehog proteins which have increased bioavailability. The hedgehog proteins are conjugated to a non-naturally-occurring polymer comprising a polyalkylene glycol group, with the proviso that the polymer is not conjugated to the N-terminus, or to lysine residues of the hedgehog protein. The hedgehog protein used in the conjugate may be a wild-type or mutant Sonic hedgehog (Shh), Indian hedgehog (Ihh) or Desert hedgehog (Dhh) protein, or may be a hedgehog (but or methods of a hedgehog tusion protein. The invention also relates to methods of 

defining and mapping functionally important regions of a protein by modifying accessible amino acid side chains, and determining the effect the position and/or type of modification have on the activity of the protein. The hedgehog polymer conjugates may be used in the management of various medical conditions including various neurological disorders, inflammatory and autochmune diseases, and cancers. In particular, they may be used to prevent preventing or ameliorate neurodogenerative disorders (e.g., Parkinson's disease, Huntington's disease, Alzheimer's disorders (e.g., Parkinson's disease, neurological injury and trauma; immunological diseases of the nervous system (e.g., multiple clerosis); stroke; and malignant gliomas, medulloblastomas and neurosectodermal tumours. The modifications made to the hedgehog protein neurosectodermal tumours. The modifications made to the hedgehog protein an improved ability to stay in the vasculature for longer periods of time), increased stability in solution, protection from proteciply to remain in the vasculature for prolonged periods may allow a hedgehog protein of the invention to cross the blood-brain barrier, and an protein of the invention to cross the blood-brain barrier, and an hedgehog protein in powder form. The present sequence represents a headgehog protein in powder form. The present sequence represents a human sonic hedgehog mutagenic primer used in an exemplification of the invention.

1 Sequence 7, Application US/08068747

1 Patent No. S695933

GENERAL INFORMATION:

APPLICANT: Hudson, Thomas J.

APPLICANT: Housman, David E.

TITLE OF INVENTION: Direct Determination of Expanded

CORRESPONDENCE ADDRESS:

ADDRESSER: Hamilton, Brook, Smith & Reynolds, P.C.

STREET: Two Militia Drive

COUNTRY: USA

ZIP: DAXINGENCE ADDRESSER

MEDIUM TYPE: TOPPY disk

COMPUTER: IBM PC Compatible

C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ATTORNEY/AGENT INFORMATION:

| Sequence 5, Application US/09102491
| Sequence 5, Application US/09102491
| Patent No. 6238876
| GENERAL INPORMATION:
| APPLICANT: Altaba, Ariel Ruizi
| TITLE OF INVENTION: METHODS AND MATERIALS FOR THE DIAGNOSIS AND TREATMENT |
| TITLE OF INVENTION: METHODS AND MATERIALS FOR THE DIAGNOSIS AND TREATMENT |
| TITLE OF INVENTION: OF SPORADIC BASAL CELL CARCINOMA |
| FILE REFERENCE: 1049-1-008N |
| CURRENT APPLICATION NUMBER: 60/050,286 |
| EARLIER APPLICATION NUMBER: 60/050,286 |

SOFTWARE: PatentIn Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/748,591
FLING DATE:
CLASSIFICATION: 435
ATTORNEY/AGENT INFORMATION:
NAME: Sherwood, Pamela J
REGISTRATION NUMBER: 06510/067001
TELEPHONE: (415) 834-0875
INFORMATION FOR SEQ ID NO: SEQUENCE CHARACTERISTICS:
LENGTH: 19 base pairs
TYPE: nucleic acid
STRANDEDNESS: single
APPLICANT: Hu, Zhilan
APPLICANT: Bonifas, Jeanette
TITLE OF INVENTION: Mutant Human Hedgehog Gene
NUMBER OF SEQUENCES: 23
CORRESPONDENCE ADDRESS:
ADDRESSE: Fish and Richardson

Patent No. 6238876

GENERAL INFORMATION:
TITLE OF INVENTION: OF SPORADIC BASAL CELL CARCINOMA

TITLE OF INVENTION: OF SPORADIC BASAL CELL CARCINOMA

TITLE REPERENCE: 1049-1-008N

CURRENT APPLICATION NUMBER: US/09/102,491

GERENT APPLICATION NUMBER: 60/050,286

EARLIER APPLICATION WHERE: 1998-06-22

MUMBER OF SEQ ID NOS: 9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 27
US-08-742-755A-31/C
is Sequence 31. Application US/08742755A
; Sequence 31. Application US/08742755A
; Patent No. 5858671
; GENERAL INFORMATION:
; APPLICANT: Jones, Duglas H.
; TITLE OF INVENTION: An Iterative and Regenerative DNA
; TITLE OF INVENTION: Sequencing Method
; TITLE OF SEQUENCES: 41
; NUMBER OF SEQUENCES: 41
; NUMBER OF SEQUENCES: 5
; ADDRESSEE: LAHIVE & COCKFIELD, LLP
; STREET: 28 State Street
; CITY: Boston
; STREE: Massachusetts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DB 1; Length 21;
                                                                                     Sequence 24, Application US/09277078

Patent No. 6312949

GENERAL INPORMATION:
APPLICANT: Salmar, Theo
APPLICANT: Balmar, Theo
APPLICANT: Gage, Fred H.
TILLE OF INVENITON: EXPRESSION
FILLE REPERENCE: 07251/031001

US-09-226-683-35/c
; Sequence 35, Application US/09226683
; Patent No. 6190889
; GENERAL INFORMATION:
; APPLICANT: Jones, Douglas H.
TITLE OF INVENTION: An Iterative and Regenerative DNA;
TITLE OF INVENTION: Sequencing Method
; NUMBER OF SEQUENCES: 41
; CORRESPONDENCE ADDRESS:
; ADDRESSER: 128 State Street
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Indels
                                                                                                                                                         Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       STATE: Massachusetts
COUTRY: USA
ZIP: 02109-1875
COMPUTER READABLE PORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 65, Application US/09030701B

Patent No. 6214806

GENERAL INPORMATION

GENERAL INPORMATION

APPLICANT: Krieg, Arthur M.

APPLICANT: Krieg, Arthur M.

APPLICANT: Schwartz, David A.

TITLE OF INVENITION: USE OF NUCLEIC ACIDS CONTAINING

TITLE OF INVENITION: UNBETHYLATED CPG DINUCLEOTIDE IN THE TREATMENT OF

TITLE OF INVENITION: UPS-ASSOCIATED DISORDERS

FILE REFERENCE: C1039/7011

CURRENT APPLICATION NUMBER: 06/039,405

PRIOR APPLICATION NUMBER: 60/039,405

PRIOR PILLING DATE: 1997-02-28

NUMBER OF SEQ ID NOS: 65
